This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

* Total length 7½″, wings 3½″. Head and under part of the body carmine; the breast-feathers green at base, with some small streaks of bright yellow; crown and spot on the lower part of back purplish black; nape, back, wings, and base of tail-feathers green; sides of rump bright yellow; thighs green, streaked with bright yellow; knees purplish black; middle tail-feathers mostly carmine, with the tips yellow; lateral feathers green, with the inner web carmine and the tips bright yellow.

† Total length 10″, wings 8½″. Brownish black; crown, margins of the neck-feathers, a spot on the lower part of neck and another at the lower part of breast, middle of abdomen, and the inner webs of tail-feathers and quills, bright yellow, tinged with orange; lower part of back opaline white; thighs blood-red; greater wing-coverts, outer margins of quills and tail-feathers green, the latter tinged with yellow and blue in parts; sides of body and upper tail-coverts black; under tail-coverts deep purplish blue. In another specimen the orange-yellow is represented by blood-red or reddish-yellow, and is probably that of the adult bird. The young bird differs from the adults by the yellow being less prominent, while that on the inner webs of the tail-feathers is partly spotted; the ends of the tail-feathers are pointed, and the shafts also prolonged into very slender points: the last-mentioned character rather induces the supposition that the species named *Eos scintillatus* is that of a young bird, and probably the young of *E. rubrifrons*?
